C# PROGRAMMING

(330)

NATIONAL 2025

PRODUCTION:

National_CSharp

_____ (715 points)

Test Time: 90 minutes

Solution and Project (There is NO partial credit) (NOTE: UC represents uppercase and LC represents lowercase)		
The VS project file is present on the flash drive in a single folder with your contest ID		10 points
Program Execution (If the program does not execute, then the remaining items in this section receive a score of zero)		
Message Box appears showing the file pathway to where the text files are located and displays the number of files in the folder.		30 points
Form displays and the BPA logo is removed from panel.		10 points
STEP 1: Enter LIST command causing list to be generated, vertical scrollbar appears and allows user to view all records.		10 points
Generated list has 9 Dairy and 9 Produce products		50 points
Format of the displayed list matches sample output in terms of the order of printed information: first the statement with number of food-products, statement with estimated value, and the data fields for each record (all must be present and in proper order).		30 points
In the list: estimated value , Total Value , COST of Goods Sold are in US currency; Days of Sales Inventory is an integer (no double values).		20 points
STEP 1: Wrong command is entered in txtCommand and message box with statement “Command Entry Error” appears. Closing message box returns cursor focus command text entry box and clears previous entry		20 points
STEP 1: “ Distro ” command (UC or LC) prompts next label to appears asking which food-product to sell and txtSymbol text box appears with the cursor focus moves to STEP		10 points
STEP 2: Food-Product symbol (UC or LC) is entered prompts next label to appears asking which food-product to sell and txtKG_QA text box appears with the cursor focus moves		10 points
STEP 3: Kilograms are entered for a food-products to sell, and the list changes the information for the food-product dynamically adjusts (estimated value, Total kg, Total Value, Days of Sales Inventory, COST of Goods Sold) moves to STEP 4		10 points
STEP 1: “ Import ” command (UC or LC) prompts next label to appears asking which food-product to sell and txtSymbol text box appears with the cursor focus moves to STEP		10 points
STEP 2: Food-Product symbol (UC or LC) is entered prompts next label to appears asking which food-product to mine and txtKG_QA text box appears with the cursor focus moves		10 points
STEP 3: Kilograms are entered for a food-product to distro, and the list changes the information for the food-product dynamically adjusts (estimated value, Total kg, Total Value, Days of Sales Inventory, COST of Goods Sold) moves to STEP 4		10 points
STEP 2: Wrong symbol is entered in txtSymbol and message box with statement “You have entered incorrect symbol” appears. Closing message box returns cursor focus command text entry box and clears previous entry		20 points
STEP 3: When importing or distributing: characters are entered in txtKG_QA a message box with statement “You have entered wrong data type” appears. Closing message box returns cursor focus command text entry box and clears previous entry		30 points
STEP 3: When selling: 0 or more than the number of kilograms are entered in txtKG_QA a message box appears indicating wrong amount. Closing message box returns cursor focus command text entry box and clears previous entry		20 points

STEP 3: When importing: 0, or more than 1000 kilograms are entered in txtKG_QA a message box appears indicating wrong amount. Closing message box returns cursor focus command text entry box and clears previous entry		20 points
Solution and Project Subtotal		/330 Points

Source Code Review (There is NO partial credit) <i>NOTE: you must place the comment flag in front of the comment in your code in order to get credit. The comment flag will precede the explanation. For example, if the flag is SC1, your comment must read as “//SC1...” in front of the part of the code being reviewed. Code must work to get credit.</i>		
A comment containing the contestant number is present at the top of the Form1.cs file		10 points
SC1A-C: Form1.cs class Form1_Load() Place a SC1 comment by these four items: SC1A by the code that demonstrates the activation of the scroll; SC1B code that shows setting the fonts of all the labels to the Calibri font with the size of 12; SC1C how the background image of the panel was removed; SC1D how the panel gets its color from the background color of the windows setting.		20 points
SC2: Form1.cs class readFile() Place a in code where the file names are read dynamically to only read text files they have the capital word “Text” in them.		40 points
SC3: Form1.cs class readFile() Place in code where the message box is created and is given a path location to one of the files that will be read.		30 points
SC4A-D: Form1.cs class readFile() Place a comment by these four sections: SC4A code demonstrates reading of the file, recognizing the flags P or D; SC4B Code that recognizes the word “stop”; SC4C code that handles the construction of the objects; SC4D code for separating the fields from reading the file.. No partial credit		40 points
SC5: Form1.cs class txtCommand_KeyPress () code showing user input being gathered and passing control to the Inventory getCommand()		10 points
SC6: Form1.cs class txtSymbol_KeyPress () code showing user input being gathered and passing control to the Inventory getCommand()		10 points
SC7: Form1.cs class txtTonnage_KeyPress () code showing user input being gathered and passing control to the Inventory getCommand()		10 points
SC8: Inventory.cs class getInventoryTotalValue() code shows how all of the food-products Total Value are sum to show the estimated value of farming operation		20 points
SC9: Inventory.cs class getInventoryList() code shows how all of the food-products are printed as a list to the lblList object. Must show how estimated value is formatted into currency.		20 points
SC10: Inventory.cs class supplySKUVerification() code shows how all of the food-product symbols are checked against user input		20 points
SC11: Inventory.cs class dataEntryVerification() code shows how all of the food-product ton entries are checked against parameters of selling vs. importing.		20 points
SC12: Inventory.cs class procureInventory() demonstrates how the data entered into txtKG_QA is checked for nonnumerical entries. Must use a try catch exception handler.		20 points
SC13: Dairy.cs and Produce.cs classes calculate Total Value with getValue() . Place a SC11 comment by these two sections		10 points
SC14: Dairy.cs and Produce.cs classes calculate the Days of Sales Inventory (no hard coded data allowed, variables only) with DaysSalesOfInventory()		10 points

SC15: Dairy.cs and Produce.cs classes calculate the Cost of Goods Sold (no hard coded data allowed, variables only) with <i>costOfGoodsSold()</i> .		10 points
SC16: Dairy.cs and Produce.cs classes <i>Tostring()</i> method uses string interpolation to print all 8 of the required data values.		30 points

Calculator Challenge

You will create a basic four-function calculator using your C# in a Windows Form Application with .NET framework project (this will be done your current project). Instructions: Your task is to design and implement a simple five-function (includes modulus) calculator with the following functionalities:

- User Interface Design:
 - Add a new form to the project, it needs to be called Form2.
 - Design the layout of the calculator interface with buttons and labels.
- Display Feature:
 - Include a display feature to show the input and output of the calculator operations.
- Basic Operations:
 - Implement addition, subtraction, multiplication, and division operations.
 - Include buttons for each operation (+, -, *, /, %).
 - Ensure the calculator performs these operations accurately.
- Numeric Buttons:
 - Include buttons for digits 0-9 to input numbers.
 - Users should be able to input multi-digit numbers.
- Clear Button:
 - Implement a clear button to reset the calculator display and any ongoing calculation.
- Equal Button:
 - Include an equal button (=) to perform the calculation and display the result.
- Error Handling:
 - Implement error handling for invalid input or operations (e.g., division by zero).
 - Program must give the error message "Divide by Zero"
- Starting the Form2
 - Form2 will start when you press the calculator button that is on the bottom of Form1. This is the only way that Form2 should load. You should be able to close Form2 and return to Form1 at any point in time.

Calculator Challenge		
Form2 loads when the btnCalcuLaunch is pressed		5 points
Form2 UI Calculator has all required buttons		5 points
Form2 when pressing any numeric key the numbers appear in the display		5 points
Form2 Calculator's adding function works		5 points
Form2 Calculator's subtracting function works		5 points
Form2 Calculator's multiplication function works		5 points
Form2 Calculator's division function works		5 points
Form2 Calculator's modulus function works		5 points
Form2 Calculator's equal function works		5 points
Form2 Calculator's clear function works		5 points
Form2 when attempting to divide by zero the calculator will not allow action. You must provide a user with an "Divide by Zero" message		5 points
